Grammatisk analyse

Vi har laga ein grammatisk analysator for nord- og lulesamisk tekst (ordbøying og -avleiing, lydovergangar), og ein setningsanalysator for nord- og lulesamisk (den nordsamiske har presisjon = 97,5 % og recall = 94,4 %).

Vi har laga eit syntaktisk annotert korpus for nordsamisk, som vi har gjort tilgjengeleg for språkforskarar over internet.

Stavekontroll

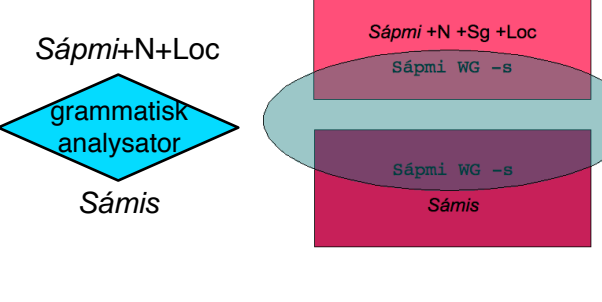

Den grammatiske analysatoren er grunnstammen i Sametinget sin stavekontroll for nord- og lulesamisk, som blir publisert i slutten av 2007 (betaversjonen ferdig i februar 2007).

Programmet inneheld også eit orddeleprogram.

A n a l y s e m e t o d a r

Vi har brukt endelege tilstandsautomatar for morfologisk analyse. Til morfofonologien bruker vi tonivåmorfologi. Analysatorane våre er kompliert med kompilaratorar frå Xerox, (*lexc*, *twolc* og *xfst*, jf. http://www.fsmbook.com/). Til syntaktisk analyse har vi brukt ein grammatisk basert syntaktisk analysator (føringsgrammatikk), *visl*g frå Syddansk universitet, jf. http://visl.sdu.dk.

Tekst frå den samiske avisa *Min Áigi*, i det samiske rettprogrammet (korrekte former: čeahhii, gávnnahit, boadašii)

Tilvide til andre samiske språk

Vi kan bruke ein grammatisk analysator for eitt språk som utgangspunkt for tilsvarende analysatorar for nært beslektta språk. Det er seks samiske skriftspråk, vi har ein analysator for to av dei, er i ferd med å lage den tredje, og ser på dei tre siste. Delar av regeloppsettet kan brukast på nytt.

Vi samarbeider med:
