Sámi Language Technology at the University of Tromsø

Lene Antonsen, Ciprian Gerstenberger, Trond Trosterud, Linda Wiechetek

Giellatekno is a research centre specialised in formal linguistics for Sámi and to

a certain extent also the other morphologically complex circumpolar languages.

Noun

Giellatekno – Centre for Sámi Language Technology

Lexicon, morphology and morphonology

Lexicon and concatenative morphology

are organised as tuples <upper level:lower level>.

The upper level represents lemma and grammar

Lexicon and concatenative morphology

features, while the lower level represents

stem, affixes and triggers for morphono-

Two-level morphology transducers are used for

morphonology, and finite-state transducers for

Giellatekno focuses on well-defined, grammar-based analysis methods that are robust enough to form the core of linguistic tools for online and offline applications.

Constraint Grammar

Morphological disambiguation as well as assigning syntactic and dependency tags is achieved with Constraint Grammar visleg3, http://visl.sdu.dk/ The North Sámi CG grammar consist of appr. 3500 rules.

Disambiguation

The correct morphological analysis for each word form is chosen according to context.

Example:

Mii eat lea

<Mii>" "mii" Pro "mii" Pro "mun" Pro eat>" "ii" V IV <leat>" "leat" V "leat" V "leat" V "leat" V "leat" V :dan>" "dat" Pro "dat" Pro "dat" Pro "dat" Pro muitalan>" "muitalit "muitalit "muitalit "muitalit "muitalit "muitali "." CLB Mii "mun" Pron Pers Pl1 Nom @SUBJ> #1->2 <eat> "ii" <aux> V IV Neg Ind Pl1 @FAUX #2->0 cleats "leat" <aux> V IV Ind Prs ConNeg @IAUX #3->

"dat" Pron Dem Sg Acc @OBJ> #4->5

"muitalit" <mv> V TV PrfPrc @IMV #5->3

muitalan>

"." CLB #6->6

Morphonological rules

logical processes.

Compilation

Consonant gradation and vowel change are handled by a set of context-sensitive morphonological rules, triggered either by phonological context alone, or by morphologically induced triggers, here WeG for weak grade and VowCH for vowel change:

	_ Vow* WeG ;
rj -> rjj	_ Vow* WeG ;
i -> á	_ VowCh ;

Compilation removes intermediate

representations between morphological

and morphonological transducers. The

result is a morphological transducer for

both word form analysis and generation.

/	lemma + grammatical tags t stem + affixes, morphophonemes, diacritics	- lexicon
(\$	removed during composition
	stem + affixes, morphophonemes, diacritics	morpho- phonology

morphology and lexicon. The North Sámi

Syntactic functions @SYNTAG>

Rules:

Nom gets **@SUBJ>** if there is no finite verb to the left, but verb to the right, and no barrier intervening.

g verb gets **@FAUX**.

g verb gets **@IAUX** if it is a possible auxiliary and leg verb to the left and a participle to the right.

ts **@OBJ>** if there is no transitive verb to the left.

gets **@IMV** if there is a copula or *orrut* to the thout other participles or Actio Essive intervening, not an auxiliary with a following Inf verb.

endency tree #1->2

pot node points to **0**, each other node points mother node.

other of @SUBJ> is the first finite verb to the left

verb with no mother is the root $\#2 \rightarrow 0$.

other of a nonfinite @IAUX is the first finite @FAUX to the left $#3 \rightarrow 2$.

The mother of @OBJ> is the first transitive main verb to the right **#4–>5**.

The mother of an infinite verb is the first @FAUX or @IAUX to the left $\#5 \rightarrow 3$.
